Artificial Intelligence Policy

The editors and the Editorial Board of *ICONN* acknowledge the fact that artificial intelligence (AI) tools and technology may support researchers in planning and conducting their work. Thus, authors may employ AI tools so long as this is done transparently and in observance of the principles of ethical and academic integrity.

The use of AI tools and technology in any stage of the research and writing process falls under the scope of the Publication Ethics and Malpractice Statement of *ICONN* (https://onomasticafelecan.ro/docs/ICONN-Ethics-and-Malpractice-Statement.pdf). Several additional provisions must be followed:

1. *ICONN* adheres to COPE's position statement regarding Authorship and AI tools (https://publicationethics.org/guidance/cope-position/authorship-and-ai-tools). AI tools and technology cannot be considered to generate arguments and substitute for scholarly interpretation. Therefore, AI cannot be listed as an author or as a co-author of any kind of manuscript submitted for publication.
2. Authors may turn to AI tools to facilitate their bibliographical research, as well as to aid them in processing and analysing large data sets, generating and editing figures (graphs), translating, proofreading, and editing manuscripts. Any such use must be explained in the Methodology section of the paper if relevant. The authors must verify the AI output to make sure that it is accurate, relevant, unbiased, and within the scope of ethical and academic integrity.
3. The use of AI technology for the correction of spelling and grammatical errors which does not imply extensive rewriting of texts does not need to be indicated (the authors should contact the editors if they have any doubts or queries).
4. Authors must be aware of any ownership claims or usage limitations underlying the employment of any content generated by the AI tools utilised. These restrictions may lead to copyright infringement and may therefore interfere with the authors' and/or with *ICONN*'s rights to use the manuscript, including its publication.
5. Authors assume full responsibility for the accuracy, relevance, validity, and authenticity of the content of their manuscripts, whether the submissions are produced using AI tools or not. At the same time, the authors must make sure that they observe the ethical and integrity standards promoted by *ICONN* and that they declare any potential conflict of interests upon submitting their manuscript for publication.
6. Editors and reviewers must not use AI technology in the peer-review process if this involves uploading manuscripts and parts of manuscripts (including data sets, tables, and figures) into AI tools, as this could lead to copyright infringement. At the same time, the peer-review process cannot be delegated to AI tools. The peer-review process should observe *ICONN*'s editorial and peer-review policies. The responsibility and accountability for conducting peer reviews rest with the human individuals who have accepted the invitation issued by the Editors.
